

VERTEX Installation Is Easy!

1 Measure bar to bar

2 Adjust size if required

3 Install Vertex

4 Silicone for glazing

5 Install glazing

6 Install cappings

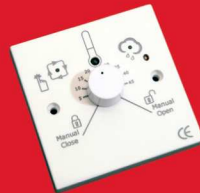

Electrical Connection Options

Plug and Go

Switch operated

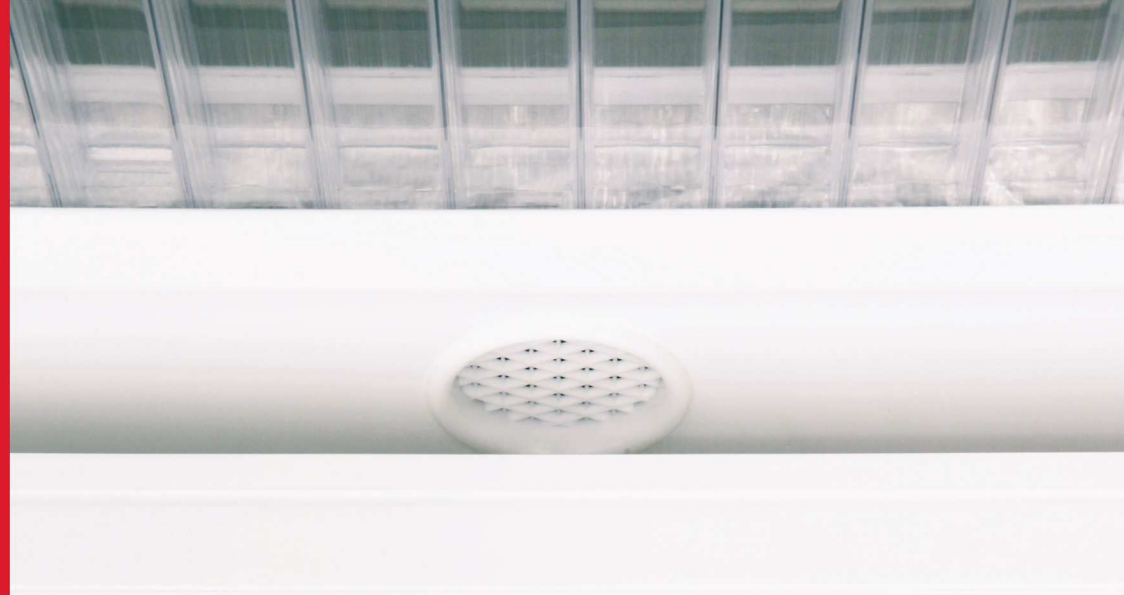

Thermostatic Climate Control Unit

VERTEX

Ridge Level Ventilators

Conservatories typically require particular attention to ventilation, this can prove difficult, awkward, intrusive and expensive.

Security is vital in all areas of the home, unattended roof vents like windows and doors need to be shut. Likewise, conventional roof vents can make ventilation impractical in wet and windy conditions. The **Vertex** unit blends seamlessly with your conservatory and avoids any potential breach in the security of your home.

Conservatories are also renowned for condensation problems due to the accumulation of humid air, causing damage to décor and furniture due to heat, moisture and the resultant mould.

Hot and humid air gathers in the roof space of conservatories. By incorporating **Vertex** Ridge Level Ventilators, air flow can be easily and economically introduced into the conservatory.

Air is extracted from the apex of the conservatory roof, expelled through the glazing bars and exhausted at the bar ends.

Here are some of the main benefits of the unique patented **Vertex** system :

- Your conservatory will be more secure as ventilation is possible without open roof vents.
- Can be retro fitted
- The risk of condensation is reduced.
- Hot stale air is removed from the conservatory.
- Damp air is removed from the conservatory.
- Thermostatic climate control units can be used.
- Air movement is created even when the outside conditions are still.
- Supply cables can be hidden within any glazing bar system.
- Minimal running costs.
- Available to fit any panel width.
- Maintenance free.

Vertex Ridge level ventilators have been specially designed to be used with any structured sheet (e.g. polycarbonate) or glass units, in conservatory roof glazing.

It provides an economical and unobtrusive way of introducing ventilation for both new and retro fit applications at an economical price.

Vertex Ridge level ventilator units are thermally broken and powered via a safe double insulated transformer providing safe extra low voltage to power the unit, included in the kit.
